

CALM WAVE 포팅 메뉴얼

목차

I. 빌드 및 배포

1. 개발 환경	3
2. 설정 파일 정보	3
3. 빌드 서버에 Docker, 자바, 깃, 젠킨스 설치	6
4. 배포 서버에 Docker, 자바, mysql, redis 설치	8
5. 배포 서버에 nginx 설치 및 https 적용	9
6. Jenkins 사용한 빌드 배포 자동화	10
7. OpenVidu 배포	15

II. 외부 서비스

1. 소셜 로그인	17
2. Teachable Machine	18

I. 빌드 및 배포

1. 개발 환경

Server : AWS EC2 Ubuntu 22.04 LTS
Visual Studio Code : 1.75.0
IntelliJIDEA : 2022.3.1(Ultimate Edition)
JVM : openjdk 11.0.17 2022-10-18
Docker : 20.10.23
Node.js : 18.13.0 LTS
MySQL : 8.0.32 for Linux on x86_64
Redis : 7.0.8
Nginx : 1.18.0 (Ubuntu)
Jenkins : 2.375.2
Openvidu : 2.25.0
Teachable Machine : 2.4.5

2. 설정 파일 정보

React

- Dockerfile

```
FROM node:alpine
WORKDIR /usr/src/app
COPY ./package* /usr/src/app/
RUN npm install
COPY ./ /usr/src/app/
CMD ["npm", "run", "start"]
```

Spring

- Dockerfile

```
FROM openjdk:11-jdk
ARG JAR_FILE=build/libs/*.jar
COPY ${JAR_FILE} app.jar
ENTRYPOINT ["java", "-jar", "-Duser.timezone=Asia/Seoul", "-Dspring.profiles.active=prod",
"/app.jar"]
```

- application.yml

spring:

config:

activate:

on-profile: local

datasource:

driver-class-name: com.mysql.cj.jdbc.Driver

url:

jdbc:mysql://localhost:3306/calmwave?serverTimezone=Asia/Seoul&useUnicode=true&characterEncoding=utf8

username: [로컬 디비 username]

password: [로컬 디비 pw]

mvc:

pathmatch:

matching-strategy: ant_path_matcher

redis:

lettuce:

pool:

max-active: 5

max-idle: 5

min-idle: 2

host: localhost

port: [레디스 포트]

jpa:

hibernate:

ddl-auto: update

properties:

hibernate:

format_sql: true

open-in-view: true

logging.level:

```
    org.hibernate.SQL: debug
my:
  secret: ${JWT_SECRET_KEY}
server:
  port: 8080
  servlet:
    context-path: /
    encoding:
      charset: UTF-8
      enabled: true
      force: true
---
spring:
  config:
    activate:
      on-profile: prod
  datasource:
    driver-class-name: com.mysql.cj.jdbc.Driver
    url: ${SPRING_MYSQL_URL}
    username: ${SPRING_MYSQL_USERNAME}
    password: ${SPRING_MYSQL_PASSWORD}
  mvc:
    pathmatch:
      matching-strategy: ant_path_matcher
  redis:
    lettuce:
      pool:
        max-active: 5
        max-idle: 5
        min-idle: 2
```

```
host: [도메인]
port: [레디스 포트]
jpa:
  hibernate:
    ddl-auto: update
  properties:
    hibernate:
      format_sql: true
    open-in-view: true
  logging.level:
    org.hibernate.SQL: debug
my:
  secret: ${JWT_SECRET_KEY}
server:

  servlet:
    context-path: /
    encoding:
      charset: UTF-8
      enabled: true
      force: true
```

3. 빌드 서버에 Docker, 자바, 깃, 젠킨스 설치

- Docker 인스톨

```
sudo apt-get update
```

```
sudo apt-get install \
  ca-certificates \
  curl \
  gnupg \
  lsb-release
```

```
sudo mkdir -p /etc/apt/keyrings
```

```
curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo gpg --dearmor -o  
/etc/apt/keyrings/docker.gpg
```

```
echo \
```

```
"deb [arch=$(dpkg --print-architecture) signed-by=/etc/apt/keyrings/docker.gpg]  
https://download.docker.com/linux/ubuntu \  
$(lsb_release -cs) stable" | sudo tee /etc/apt/sources.list.d/docker.list > /dev/null
```

```
sudo apt-get update
```

```
sudo apt-get install docker-ce docker-ce-cli containerd.io docker-compose-plugin
```

- Docker Compose 인스톨

```
sudo curl -L \
```

```
"https://github.com/docker/compose/releases/download/1.28.5/dockercompose-$(uname -s)-  
$(uname -m)" \
```

```
-o /usr/local/bin/docker-compose
```

```
sudo chmod +x /usr/local/bin/docker-compose
```

- 자바 설치

```
sudo apt-get update
```

```
sudo apt-get install openjdk-11-jdk
```

- 깃 설치

```
sudo apt-get install -y git
```

- 젠킨스 설치 (docker-compose.yml)

```
version: "3"
```

```
services:
```

```
jenkins:
```

```
privileged: true
```

```
restart: always
```

```
container_name: jenkins
```

```

image: jenkins/jenkins:lts
user: root
ports:
  - "[설정할 호스트 포트]:8080"
  - "50010:50000"
expose:
  - "8080"
  - "50000"
volumes:
  - './jenkins:/var/jenkins_home'
  - '/var/run/docker.sock:/var/run/docker.sock'
environment:
  TZ: "Asia/Seoul"

```

- 젠킨스 컨테이너 안에 docker-cli 설치

4. 배포 서버에 Docker, 자바, mysql, redis 설치

- Docker 설치 (같은으로 생략)
- 자바 설치 (같은으로 생략)
- mysql, redis 설치 (docker-compose.yml)

```

version: '3'
services:
  redis:
    restart: always
    image: redis
    container_name: redis
    ports:
      - [포트번호]:6379
  mysql:
    restart: always
    image: mysql
    container_name: mysql
    ports:
      - [포트번호]:3306

```

```

volumes:
  - /mysql:/var/lib/mysql
environment:
  MYSQL_ROOT_PASSWORD: "${DB_ROOT_PASSWORD}"
  MYSQL_DATABASE: "${DB_DATABASE}"
  MYSQL_USER: "${DB_USER}"
  MYSQL_PASSWORD: "${DB_PASSWORD}"
  TZ: Asia/Seoul
command:
  - --character-set-server=utf8mb4
  - --collation-server=utf8mb4_unicode_ci

```

5. 배포 서버에 nginx 설치 및 https 적용

- nginx 설치, Let's Encrypt 설치 및 SSL 인증서 발급

```
sudo apt-get install nginx
```

```
sudo systemctl stop nginx
```

```
sudo apt-get install letsencrypt
```

```
sudo letsencrypt certonly --standalone -d [도메인]
```

- nginx.conf

```

server {
    listen 80;
    server_name [도메인];
    server_tokens off;
    if ($host = [도메인]) {
        return 301 https://$host$request_uri;
    } # managed by Certbot
    return 404; # managed by Certbot
}

server {
    listen 443 ssl;
    server_name [도메인];
    server_tokens off;

```

```

ssl_certificate /etc/letsencrypt/live/[도메인]/fullchain.pem;
ssl_certificate_key /etc/letsencrypt/live/[도메인]/privkey.pem;
location /{
    proxy_pass http://localhost:[프론트 포트];
}
location /api/ {
    proxy_pass http://localhost:[백엔드 포트]/;
}
}

```

- 파일 연동 및 테스트

```
sudo ln -s /etc/nginx/sites-available/nginx.conf /etc/nginx/sites-enabled/nginx.conf
```

```
sudo nginx -t
```

- nginx 재시작

```
sudo systemctl restart nginx
```

6. Jenkins 사용한 빌드 배포 자동화

- 젠킨스 플러그인 설치

Gitlab Plugin, Generic Webhook Trigger Plugin, docker pipeline plugin, ssh agent plugin 설치

- 백엔드 파이프라인

```

pipeline {
    agent any
    environment {
        repository = "[도커허브 리포지토리]"
    }
    stages {
        stage("Set Variable") {
            steps {
                script {
                    PREV_BUILD_NUM = ("${env.BUILD_NUMBER}" as int) - 1

```

```

        CONTAINER_NAME = "backend"
        DOCKER_HUB_CREDENTIAL = "dockerhub-credential"
        SSH_CONNECTION = "ubuntu@[도메인]"
        SSH_CONNECTION_CREDENTIAL = "Deploy-Server-SSH-Credential"
        GIT_CRED = "git-credential"
        GIT_URL = "[깃 url]"
    }
}

stage('checkout') {
    steps {
        git branch: 'release/BE',
            credentialsId: "${GIT_CRED}",
            url: "${GIT_URL}",
            poll: true,
            changelog: true
    }
}

stage("Clean Build Test") {
    steps {
        dir ('backend') {
            sh 'chmod +x gradlew'
            sh './gradlew clean bootJar'
        }
    }
}

stage("Build Container Image") {
    steps {
        script {
            dir ('backend') {
                image = docker.build repository + ":backend_${env.BUILD_NUMBER}"
            }
        }
    }
}

```

```

stage("Push Container Image To Docker Hub") {
    steps {
        script {
            docker.withRegistry("https://registry.hub.docker.com",
DOCKER_HUB_CREDENTIAL) {
                image.push("backend_${env.BUILD_NUMBER}")
            }
        }
    }
}

stage("Cleaning up") {
    steps {
        sh """"docker images | grep "backend_" | awk '{print \$1 ":" \$2}' | xargs docker rmi""""
// docker image 제거
    }
}

stage("Server Run") {
    steps {
        sshagent([SSH_CONNECTION_CREDENTIAL]) {
            // 이전 컨테이너 삭제
            sh "ssh -o StrictHostKeyChecking=no ${SSH_CONNECTION} 'docker rm -f
${CONTAINER_NAME}'"
            // 이전 이미지 삭제
            sh "ssh -o StrictHostKeyChecking=no ${SSH_CONNECTION} 'docker rmi -f
$repository:backend_${PREV_BUILD_NUM}'"
            // 최신 이미지 PULL
            sh "ssh -o StrictHostKeyChecking=no ${SSH_CONNECTION} 'docker pull
$repository:backend_${env.BUILD_NUMBER}'"
            // 이미지 확인
            sh "ssh -o StrictHostKeyChecking=no ${SSH_CONNECTION} 'docker images'"
            // 환경변수 파일 실행권한 주기
            sh "ssh -o StrictHostKeyChecking=no ${SSH_CONNECTION} 'chmod +x
/home/ubuntu/main.env'"
            // 최신 이미지 RUN
            sh "ssh -o StrictHostKeyChecking=no ${SSH_CONNECTION} 'docker run -d --
name    ${CONTAINER_NAME}    --env-file    /home/ubuntu/main.env    -p    [포트번호]:8080
$repository:backend_${env.BUILD_NUMBER}'"

```

```

        // 컨테이너 확인
        sh "ssh -o StrictHostKeyChecking=no ${SSH_CONNECTION} 'docker ps'"
    }
}
}
}
}
}

```

- 프론트엔드 파이프라인

```

pipeline {
    agent any
    environment {
        repository = "[도커허브 리포지토리]"
    }
    stages {
        stage("Set Variable") {
            steps {
                script {
                    PREV_BUILD_NUM = ("${env.BUILD_NUMBER}" as int) - 1
                    CONTAINER_NAME = "frontend"
                    DOCKER_HUB_CREDENTIAL = "dockerhub-credential"
                    SSH_CONNECTION = "ubuntu@[도메인]"
                    SSH_CONNECTION_CREDENTIAL = "Deploy-Server-SSH-Credential"
                    GIT_CRED = "git-credential"
                    GIT_URL = "[깃 url]"
                }
            }
        }
    }

    stage('checkout') {
        steps {
            git branch: 'release/FE',
                credentialsId: "${GIT_CRED}",
                url: "${GIT_URL}",
                poll: true,
                changelog: true
        }
    }
}

```

```

}

stage("Build Container Image") {
    steps {
        script {
            dir ('frontend') {
                image = docker.build repository + ":frontend_${env.BUILD_NUMBER}"

            }
        }
    }
}

stage("Push Container Image To Docker Hub") {
    steps {
        script {
            docker.withRegistry("https://registry.hub.docker.com",
DOCKER_HUB_CREDENTIAL) {
                image.push("frontend_${env.BUILD_NUMBER}")
            }
        }
    }
}

stage("Cleaning up") {
    steps {
        sh """"docker images | grep "frontend_" | awk '{print \$1 ":" \$2}' | xargs docker rmi""""
// docker image 제거
    }
}

stage("Server Run") {
    steps {
        sshagent([SSH_CONNECTION_CREDENTIAL]) {
            // 이전 컨테이너 삭제
            sh "ssh -o StrictHostKeyChecking=no ${SSH_CONNECTION} 'docker rm -f
${CONTAINER_NAME}'"
            // 이전 이미지 삭제
            sh "ssh -o StrictHostKeyChecking=no ${SSH_CONNECTION} 'docker rmi -f

```

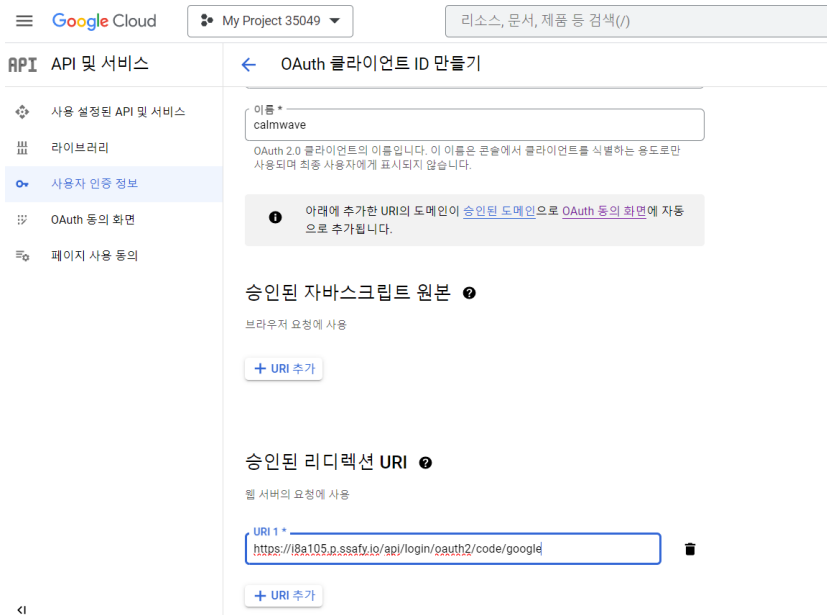

- OpenVidu 포트 개방

```
sudo ufw allow OpenSSH
sudo ufw enable
sudo ufw allow 80/tcp
sudo ufw allow 443/tcp
sudo ufw allow 3478/tcp
sudo ufw allow 3478/udp
sudo ufw allow 40000:57000/tcp
sudo ufw allow 40000:57000/udp
sudo ufw allow 57001:65535/tcp
sudo ufw allow 57001:65535/udp
```

- OpenVidu 실행

```
# 시작
cd /opt/openvidu
sudo ./openvidu start

# 종료
cd /opt/openvidu
./openvidu stop
```

2. Teachable Machine

1. <https://teachablemachine.withgoogle.com/> 들어가서 포즈 프로젝트 선택
2. 클래스 생성하여 웹캠으로 촬영
3. 모델 학습시키기 버튼 클릭
4. 학습 완료 후 업로드(공유 가능한 링크) 선택 -> 모델 업로드
5. 모델 업로드가 끝나면 공유 가능한 링크와 사용할 코드 스니펫 제공해 줌. 이를 사용하여 리액트에서 개발.
